

Cleistothecia of the fungus *Podosphaera leucotricha* (Ell. et Ev.) Salm. under the conditions of Czechoslovakia

Kleistotécie huby *Podosphaera leucotricha* (Ell. et Ev.) Salm.
v podmienkach Československa

Jozef Molnár*)

Cleistothecia of the fungus *Podosphaera leucotricha* (Ell. et Ev.) Salm. occur every year as early as mid-June under the conditions of Czechoslovakia. The degree of the differentiation of ascospores is different and is affected by atmospheric conditions, being supported by dry and warm weather. It has been observed that the differentiation continues in spring after the overwintering of the perithecia. Ascospores did not germinate.

Kleistotécie huby *Podosphaera leucotricha* (Ell. et Ev.) Salm. sa v podmienkach Československa vyskytujú každoročne už v prvej polovici júna. Stupeň diferencovanosti askospór býva rozdielny a je ovplyvňovaný povetnostnými podmienkami. Teplé a suché počasie stupeň diferencovanosti podporuje. Bolo pozorované, že diferenciácia askospór prebieha aj po prezimovaní peritécií na jar. Askospóry neboli klíčivé.
