

The yeasts of the different genera transferred by insects on the lowlands of Záhorie

Kvasinky rôznych rodov prenášané hmyzom na Záhorskej nížine

Elena Sláviková a Anna Kocková-Kratochvílová

Yeast and yeast-like microorganisms transferred by ants *Formica rufa* and ladybirds were isolated from some areas of lowlands of Záhorie. The group of the 21 strains of the yeasts, which were classified to several genera is described. They were isolated from the surface of ants from some areas of lowlands Záhorie in association with two great genera *Debaryomyces* and *Aureobasidium* previously mentioned in our country.

Popisuje se skupina 21 kmeňov kvasiniek zaradených do niekoľkých rodov, ktoré boli spolu s dvomi veľkými skupinami kvasiniek a kvasinkovitých mikroorganizmov z rodov *Debaryomyces* a *Aureobasidium* izolované z povrchu tiel mravcov z niekoľkých oblastí Záhorskej nížiny.
